

An ACT-R 5.0 Model of a Predator UAV Air Vehicle Operator

2 August 2002

Jerry Ball
Kevin Gluck
Michael Krusmark
Mathew Purtee
Stu Rodgers

Air Force Research Laboratory
Mesa, AZ

Terminology

- **Predator (RQ1A) UAV**
 - AKA Uninhabited Aerial Vehicle
 - AKA Unmanned Air Vehicle
- **Air Vehicle Operator (AVO)**
 - AKA Predator “Pilot”
- **Performance and Learning Models (PALM) Lab**
 - PALM Lab Subjects AKA “PALM Pilots”
- **Synthetic Task Environment (STE)**
 - Simulator plus built in tasks and performance data collection
- **Subject Matter Expert (SME)**

UAV Synthetic Task Environment

- Developed with New World Vistas funding from AFOSR
- Includes basic maneuvering, reconnaissance, and landing tasks
- Dynamic environment involving time-constrained decision-making and psychomotor skill
- There will be a demo at Cog Sci 2002 (Lunch on Friday)
- Available for use by Cognitive Science community

UAV STE Tasks

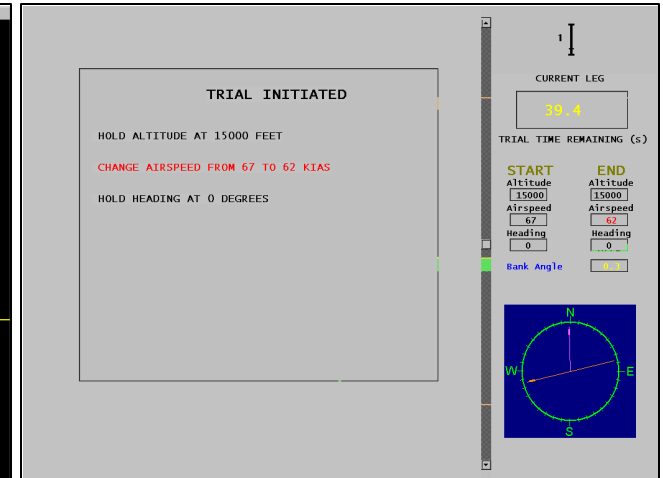

Task 1 Basic Maneuvering (We are here)

Heads-Up Display

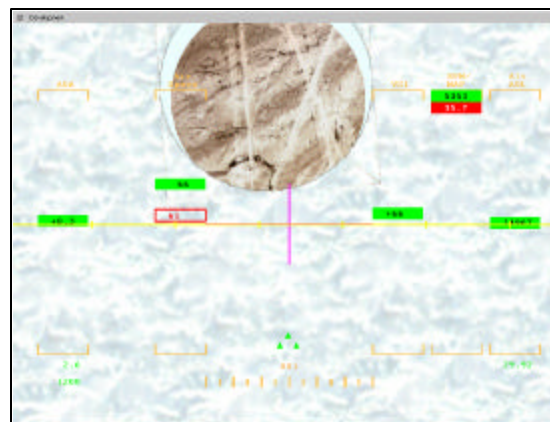

Task Screen

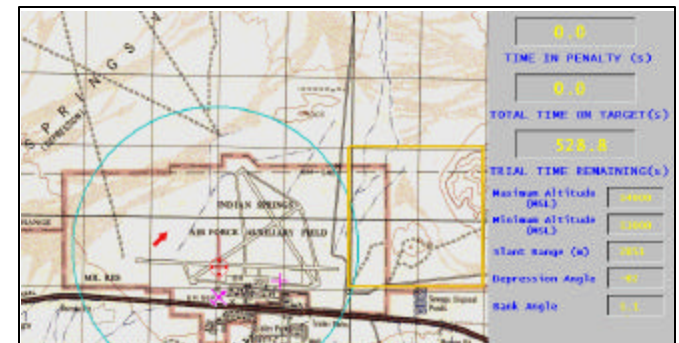

Task 3 Reconnaissance

Ground Camera

Tracker Map

Basic Maneuvering

Segment 1

Hold altitude at 15000 feet.

Hold heading at 0 degrees.

Change airspeed from 67 to 62 knots.

Segment 2

Hold altitude at 15000 feet.

Hold airspeed at 62 knots.

Change heading from 0 degrees to 180 degrees.

Segment 3

Hold heading at 180 degrees.

Hold airspeed at 62 knots.

Change altitude from 15000 feet to 15200 feet

-
-
-

Segment 7

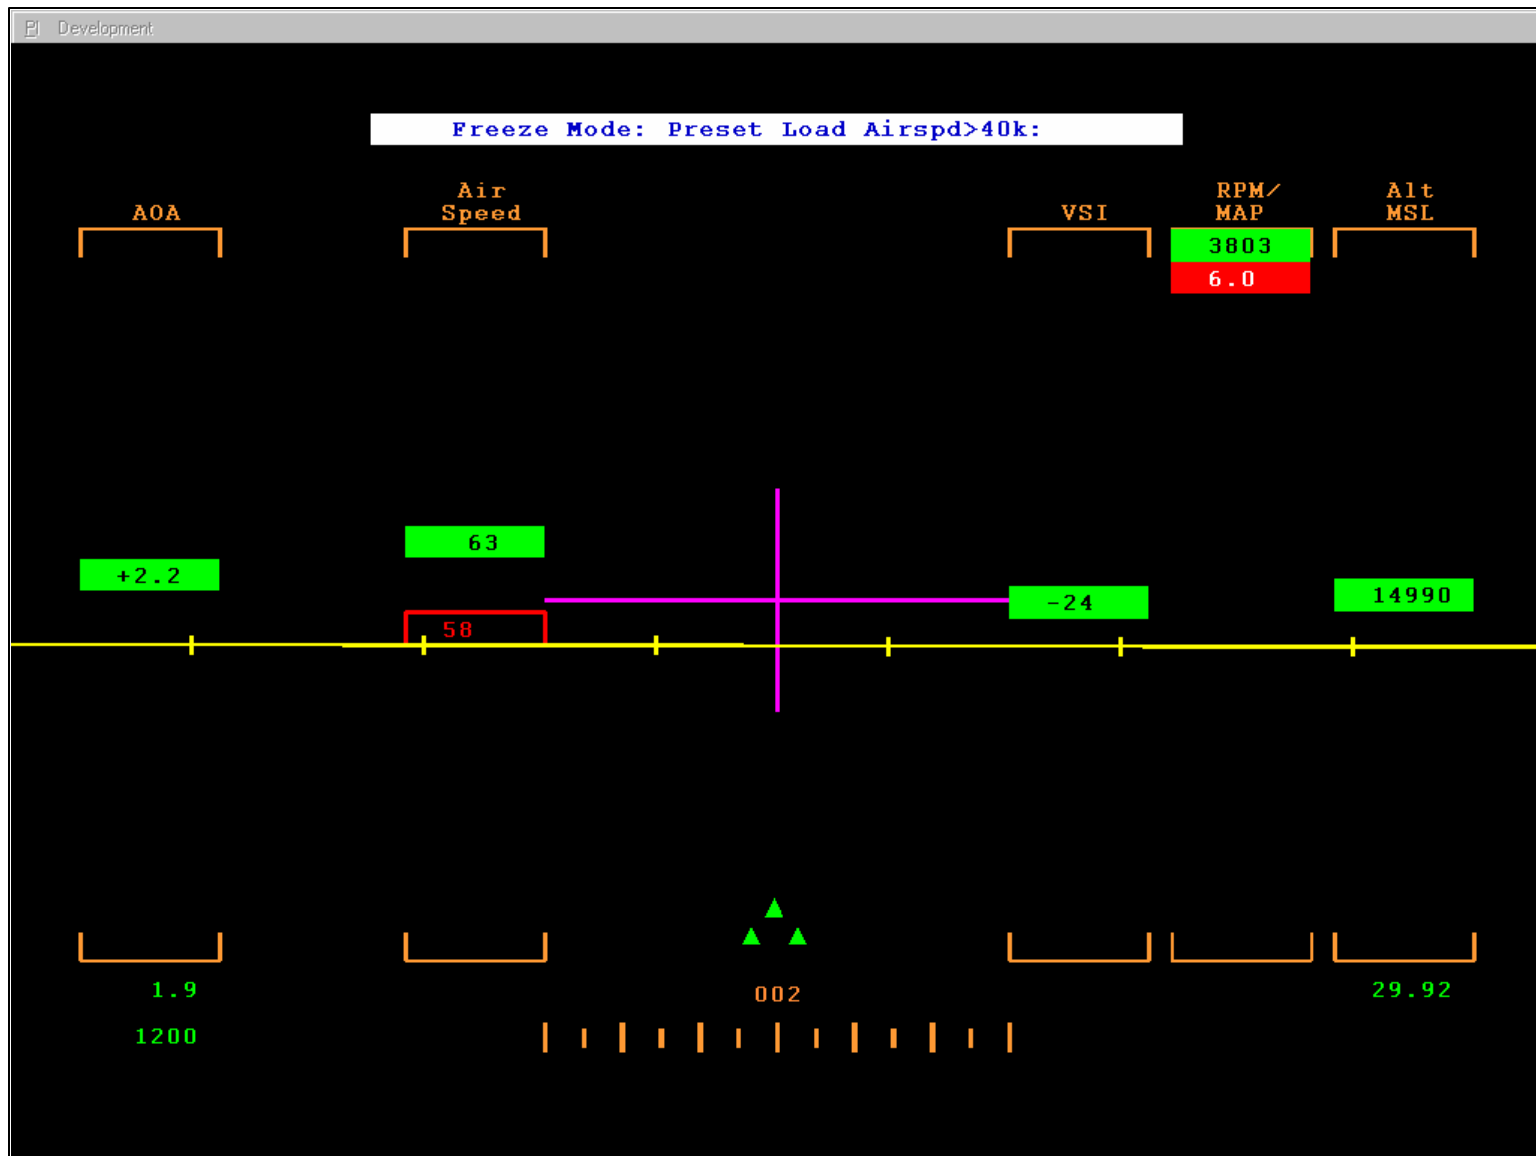

Change everything!

**Version 3 Model does
Segments 1, 2 and 3**

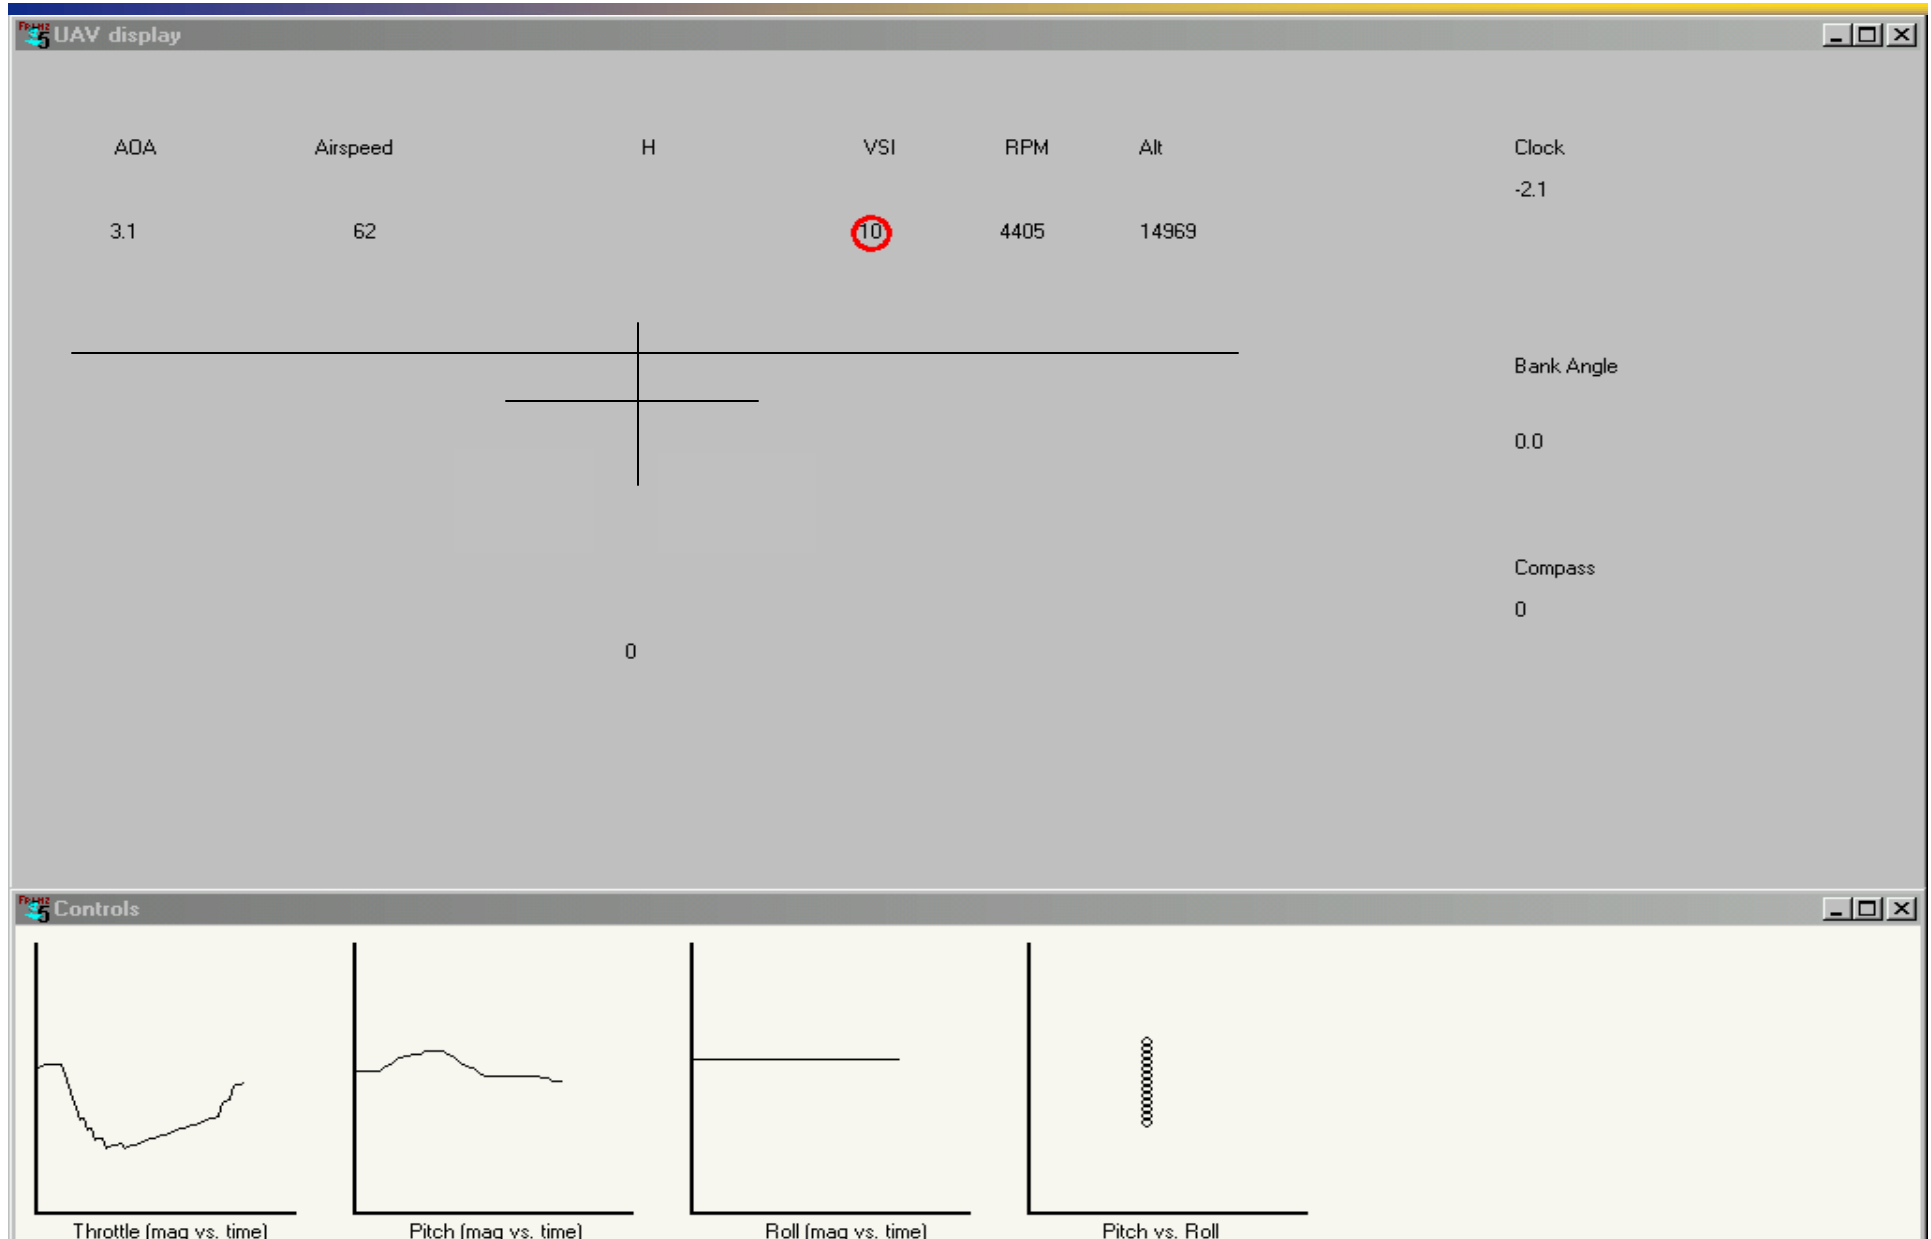

UAV Heads-Up Display

ACT-R/PM Heads-Up Display

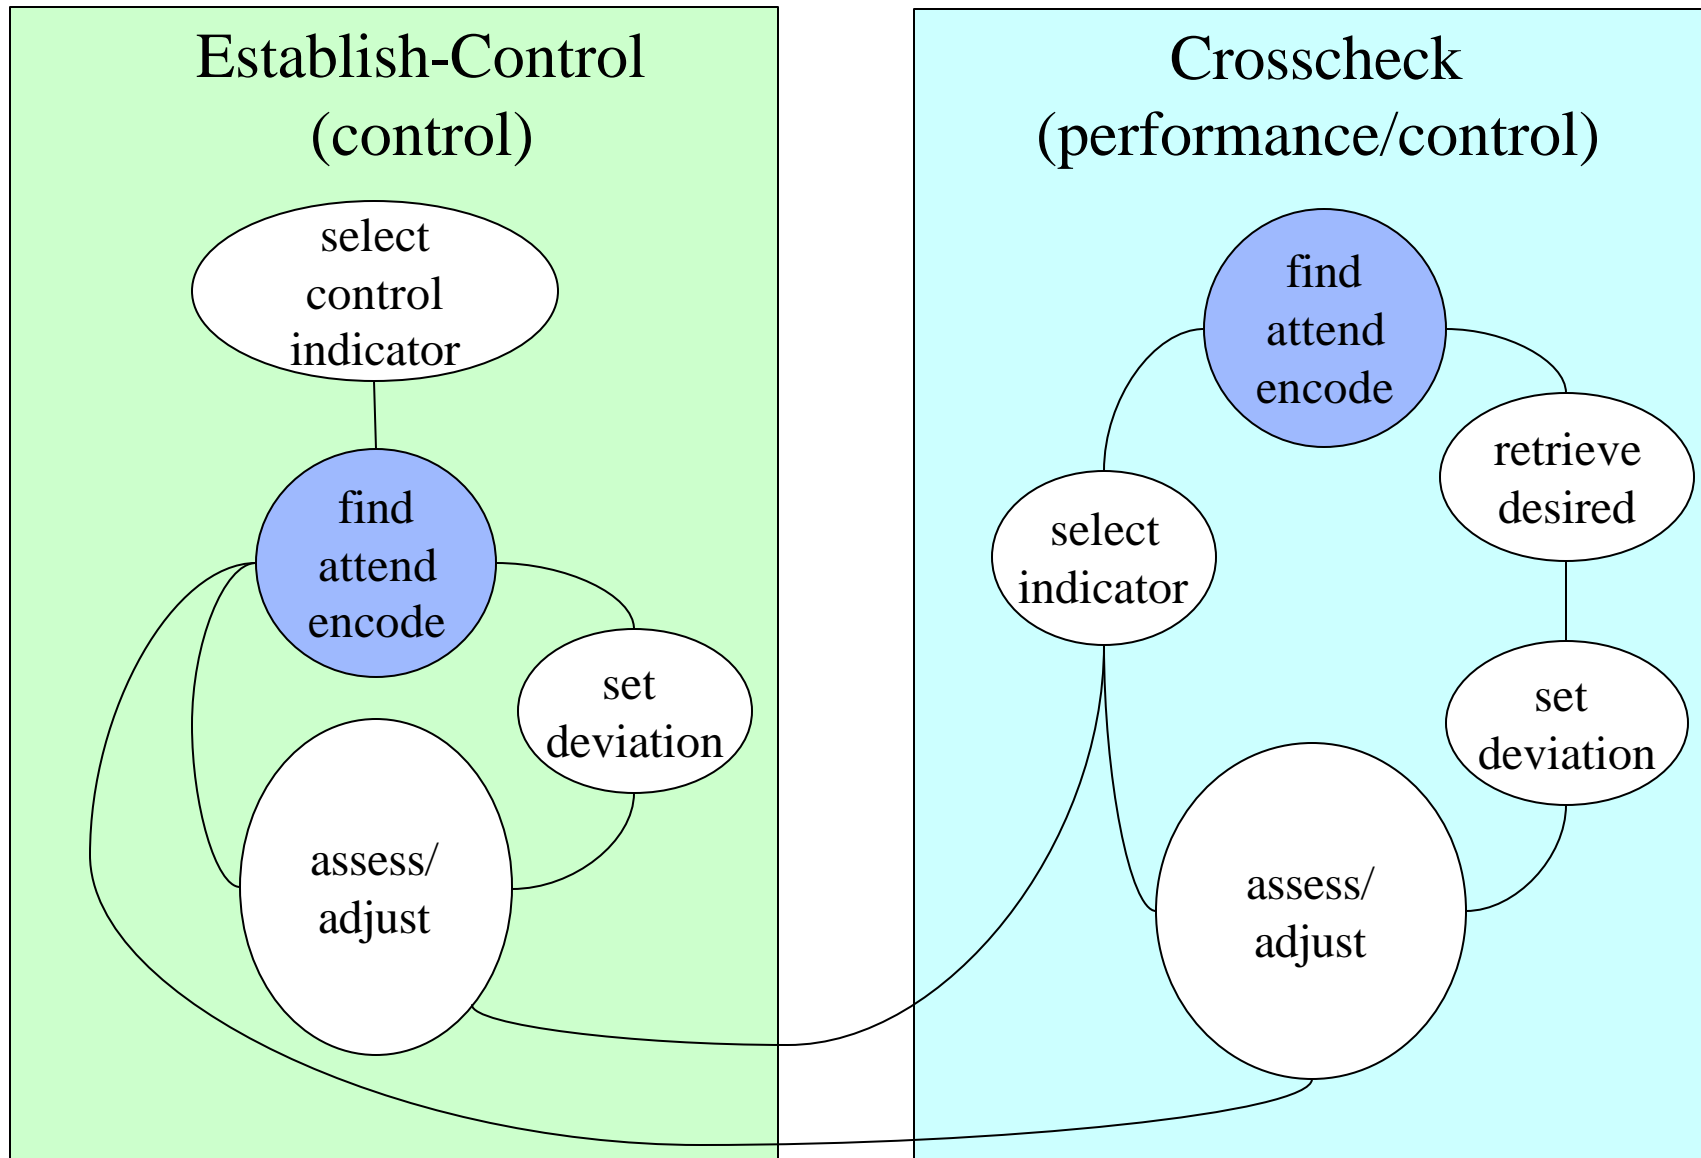

Indicator Types

- **Control – first order effect**
 - Pitch
 - Bank
 - RPM
- **Performance – second order effect**
 - Airspeed
 - Altitude
 - Heading
 - Vertical Speed

Version 3 Model Design

Parameters

Expected gain noise	1
Goal activation	1
Latency factor/exponent	1
Base-level learning	.5
Activation noise	.25

Base-level activation

- estimated globally by assuming 3000 hours of flight/study time over 12 years
- used model to estimate # retrievals per minute of flight time

Human-Model Comparison Data

Data sources:

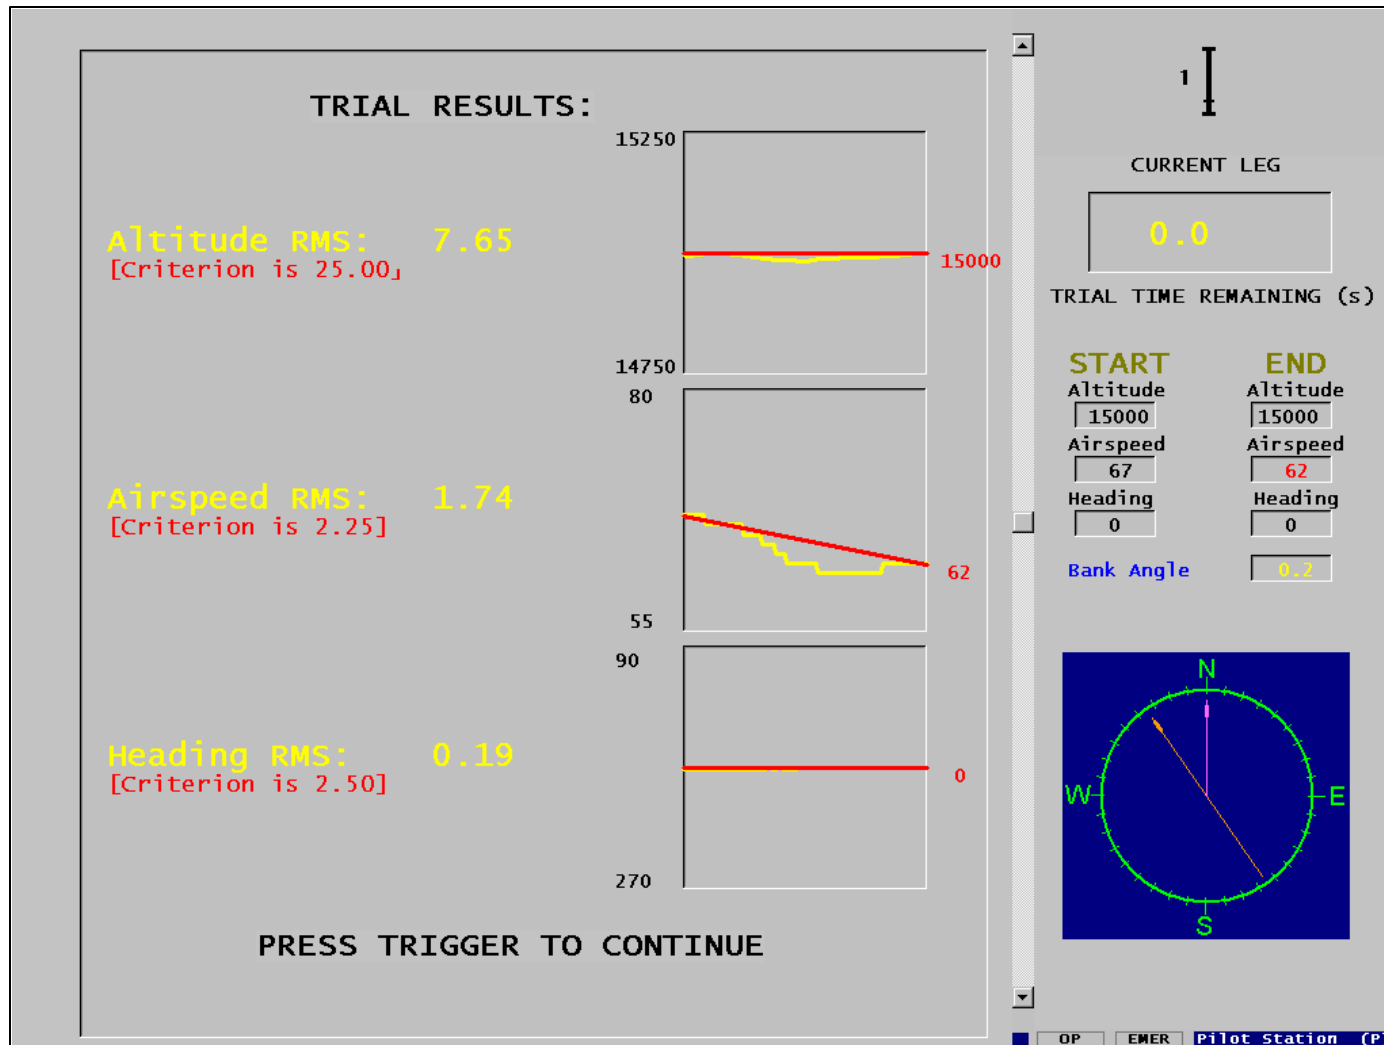

- **Performance Deviation**
- **Eye Tracking**
- **Verbal Protocol**

Data are from successful trials only:

- **when pilot/model meets criteria on altitude, airspeed, & heading**

Performance Deviation Data Feedback Screen

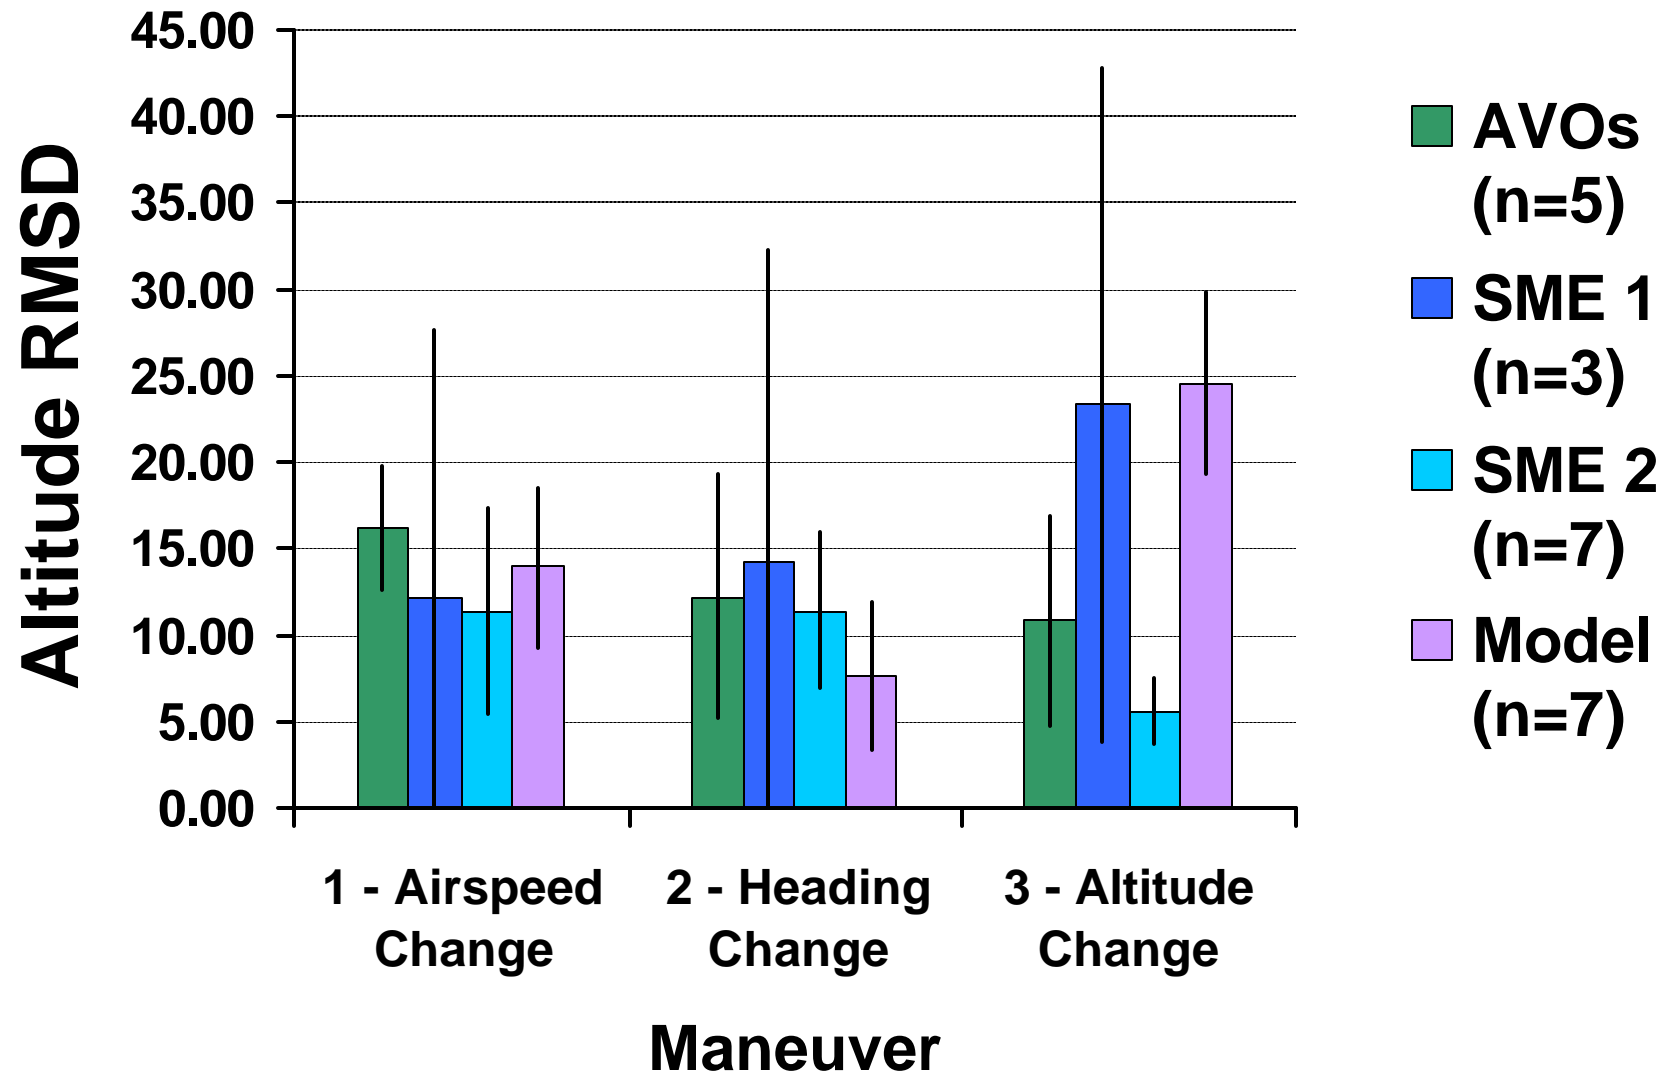

— = ideal performance — = actual performance RMS = Root Mean Squared Deviation

Performance Deviation Data: Mean of Altitude RMSD's

Error Bars show 95% CI of Mean

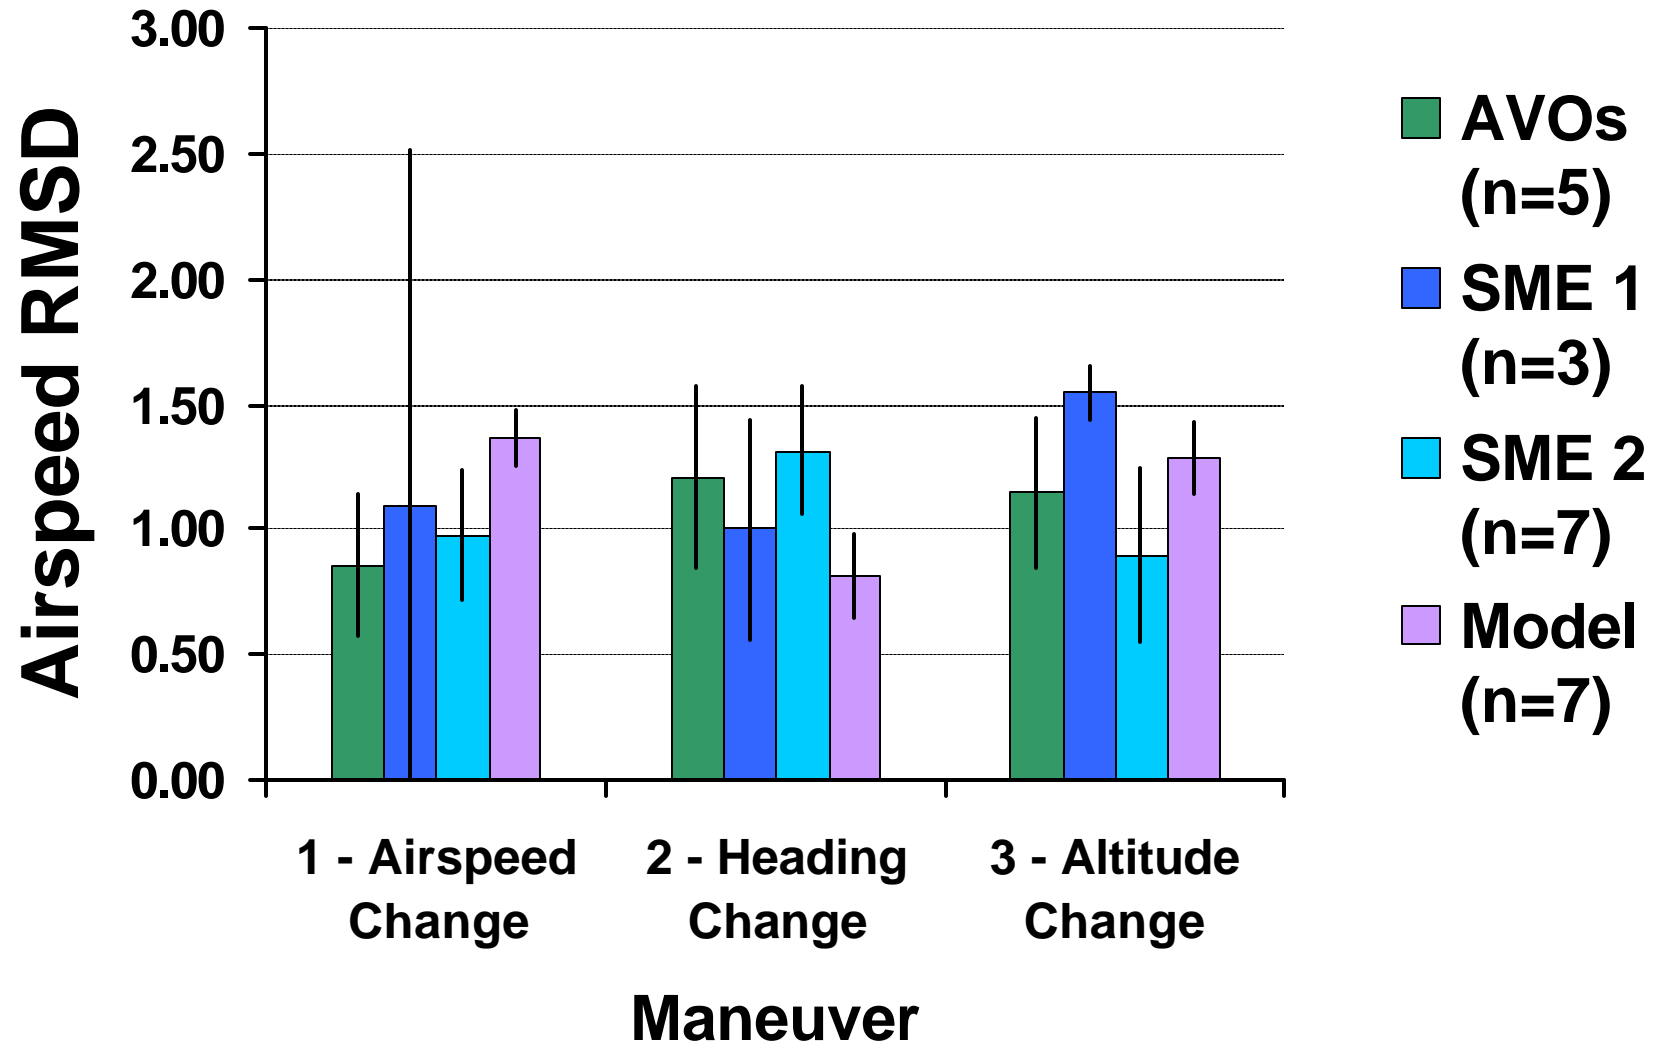

Performance Deviation Data: Mean of Airspeed RMSD's

Error Bars show 95% CI of Mean

Performance Deviation Data: Mean of Heading RMSD's

Error Bars show 95% CI of Mean

Point of Regard & Concurrent Verbal Report Data

Fixation & Verbalization Data Maneuvers 1, 2, & 3

Model Achievements

- Implemented the UAV Operator Model in latest version of ACT-R (5.0)
- Implemented a “Mock” HUD using the new perceptual-motor component of ACT-R 5.0
- Linked the UAV Operator Model directly to a complex, high-fidelity simulation environment that was **not** originally designed for interaction with external software.
- Version 3 of the model performs basic maneuvering segments 1 to 3 in a manner comparable to expert human performance

Model Achievements Version 3

- **Model distinguishes establishing control from normal crosscheck** (combination of proactive and reactive behaviors more consistent with SME interviews and Air Force Manual on Instrument Flight)
- **Model has declarative representation of differing performance and control requirements across time segments**
- **Model distinguishes different goal** (straight and level flight) during lead-in period from rest of trial
- **Following lead-in period, model now initiates actions based on requirements for segment** (e.g. initiate right turn, initiate climb)

Continuing Model Challenges

- **Synchronization of logical time with STE** (really a system architecture issue, not an ACT-R issue)
- **Model too slow – clearly not processing the screen as fast as a human can**
 - may need more “efficient” model implementation to take full advantage of parallelism in 5.0
- **Implementation of goal inheritance hierarchy seems unwieldy**
 - Not clear what better implementation is, that provides enough information to model for real-time aircraft control

And now for something completely different ...

Shameless Recruiting Effort

- The Air Force Research Laboratory (AFRL) is expanding its investment in cognitive science, modeling, and engineering.
- Relevant production rule:
 - IF you are a person who works in cognitive science, modeling, or engineering (at any level from recently-completed undergrad to full professor)**
 - AND you are a U.S. citizen who is curious about the various forms an AFRL position might take (gov't, contractor, National Research Council)**
 - THEN talk with Kevin Gluck about the opportunities**

Questions?
